

PowerHive

Presentation of 4° Sprint

Sprint Goal

The ability to perform all analyzes asynchronously and save them, and the possibility to choose members and batteries for optimal battery analysis. Final UI/UX improvements.

- Select members and batteries

⚠ Please select at least one producer

To start the analysis you must include at least one producer in the selection.

Add community default from saved Analysis

Lamezia Terme

- Better logic for the financial analysis

Costs Analysis

Detailed financial breakdown including battery degradation and lifespan limits.

Annual cost without batteries

1,460 € / year

Annual cost with batteries (Year 1)

657 € / year

Initial Annual Savings

803 € / year

(decreases by 2%/year)

Battery investment

500 €

Estimated Payback time

1 years

Is it convenient?

YES

Return of Investment (ROI)

The graph shows cumulative savings accounting for **2% annual degradation**. The curve flattens after year **15** (end of life). Convenience requires payback before end of life and within your 10-year target.

Insert different values

Investment Parameters

Energy Cost (€/kWh):

e.g. 0.30

Battery Lifespan (Years):

15

Max Payback (Years):

10

Degradation/Year (%):

2

Analyze Investment

Insert parameters to simulate real-world conditions (cost, battery aging, and financial targets).

-Added graphics tools for energy charts

Consumption Profiles

~2h ~3h ~4h ~6h Reset

~2h ~3h ~4h ~6h Reset

- All the analyses in asynchronous mode
